SONY

White paper

July 2016

XperiaTM C5 Ultra Dual E5533/E5563

Purpose of this document

Sony Mobile Communications product White papers are intended to give an overview of a product and provide details in relevant areas of technology.

NOTE: All illustrations, screen images, and elements are for reference only and subject to change at any time without prior notice.

Product overview

13-megapixel twin cameras

The Xperia[™] C5 Ultra Dual sports front and rear facing 13-megapixel cameras. The Xperia[™] C5 Ultra Dual uses Sony's Exmor RS mobile sensor and HDR technology to provide sharp and clear images when taking photos or selfies using your smartphone. When used with Superior Auto mode, both the front and rear facing cameras can capture crisp photos in a variety of scenes and lighting conditions.

Selfie camera that performs in any light

The Xperia[™] C5 Ultra Dual's front facing camera uses a soft LED Selfie Flash for illuminating scenes when you're taking photos of yourself or a group of people with you. Unlike the smartphone flash found on other devices, the flash on the Xperia[™] C5 Ultra Dual is square instead of round so it lights up more of the frame when you're taking a photograph. The flash also automatically adjusts to the lighting conditions to provide the appropriate illumination for a particular scene. The front facing camera also has a wide 22 mm lens with an 88-degree field of view that can handle photos involving a group of people.

An almost borderless 6" Full HD display

With a wafer-thin bezel, the Xperia[™] C5 Ultra Dual's large 6" display is almost all screen. The 6" screen is reinforced by an aluminium frame with a slight curve for a comfortable feel. In addition, the Xperia[™] C5 Ultra Dual uses Mobile BRAVIA® Engine 2 technology to produce crisp images, accurate colours and enhanced contrast.

ClearAudio+ Sony Audio technology

The Xperia[™] C5 Ultra Dual uses ClearAudio+ technology to reproduce sound and enhance audio playback. With Clear Stereo, Clear Bass and Clear Phase, your tracks are stripped of distortion and noise. The xLOUD enhancement engine delivers your music with a deeper, richer sound and powerful bass.

^{*} The E5533 and E5563 have approximately 9.6 GB of free memory available to the user for downloaded applications and their data, music, pictures and movies, while each device has up to 16 GB of flash memory in total. For more details about memory, see "Memory in Android™ devices" on page 17.

NOTE: Battery performance may vary depending on network conditions and configurations, and device usage.

5

NOTE: All performance metrics are measured under laboratory conditions.

^{**} This device meets the minimum hardware requirements to support Class 10 / UHS Speed Class 1 Flash memory. Flash memory performance is dependent on the application and task being performed on the device. If you would like to know about your memory card, refer to the technical specifications that came with the card.

^{***} The TTY (Teletypewriter) feature is for deaf or hearing-impaired users.

^{****} Values are according to GSM Association Battery Life Measurement Technique as performed in controlled laboratory conditions. Actual time may vary.

Technologies in detail

The information presented in this section is a general overview of the technology incorporated into the product. However, hardware and software levels of compliance to standards and specifications vary between products and markets. For more information, contact Sony Mobile Developer World or the relevant Sony representative.

DLNA Certified TM (Digital Living Network Alliance)

| Supported Device Classes | M-DMS - Mobile Digital Media Server Media Types: images, music and video Summary: The digital media server exposes the media files in your device to a Wi-Fi® network. The files can then be accessed from other DLNA Certified TM clients. M-DMP - Mobile Digital Media Player Media Types: image, video and music Summary: You can play content stored on another device, for example, a server or a PC, directly on your device. M-DMC - Mobile Digital Media Controller Media Types: image, video and music Summary: Digital Media Controllers find content offered by a DMS or M-DMS and match it to the rendering capa- billities of a DMR — setting up the connections between the DMS and DMR. +PU+ Media Types: image, video and music Summary: You can play media in your device on another device, such as a TV or a PC using 2 box push technol- ogy. +PU+ is integrated in the Album, Movies and Music applications. +DN+ Media Types: image, video and music Summary: You can download content stored on another device, for example, a server or a PC, and play the down- loaded content directly on your device. +UDO+ Media Types: image, music and video Summary: A media server uploading function that allows media files to be uploaded to Xperia devices from other DLNA Certified TM clients. |
|--------------------------|---|
| Supported Bearers | Wi-Fi® Wi-Fi Direct® |
| DRM Support | The DLNA Certified TM implementation does not support DRM-protected content. |

Positioning - location based services

Supported standards:

- OMA Secure User Plane Location (SUPL) v1.0
- 3GPP™ Control Plane location (incl. Emergency location)

Supported satellite systems:

- GPS
- GLONASS

NOTE: When needed, the device automatically uses a combination of all available satellite system to accurately provide location information.

Provisioning (OMA CP)

OMA CP version 1.1

Memory in Android™ devices

To use Android devices efficiently, users should be aware of the different types of device memory. This knowledge is important in order to understand, for example, where data such as music, photos and videos is saved; how many apps can be downloaded from Google Play™; and how photos can be copied to a PC.

Information regarding memory presented in this section may be useful to developers when optimising applications for mobile devices.

Generally, all Android devices share the same basic memory setup. What differs is how much memory is available to you via the different types of memory, and whether your device uses an external SD card or an internal memory chip. Any information specific to the particular device model described in this White Paper is noted as such.

Types of memory

The types of memory described and numbered below are consistent with the terminology used in Sony mobile device menus and in other content relating to 2015 Xperia[™] devices:

Dynamic Memory (also known as RAM) is used by applications that run when the device is turned on.
The amount of Dynamic Memory influences how many applications and operating system services can
run at the same time. The Android operating system automatically closes applications and services
that are not being used.

However, such automatic functionality has limits. For example, if a lower amount of free RAM is available to applications after a new release of the operating system (due to increased capabilities in the system), device speed will eventually be impacted. This is the main reason that a device cannot be indefinitely upgraded to newer releases of Android[™].

If you experience problems with RAM, for example, if the device runs slower than usual or if the Home application restarts frequently when you leave an application, you should minimise the use of apps that run all the time. Social networking apps that connect and update their data online and animated backgrounds are examples of apps that are always running and affect RAM performance. To minimise RAM issues, you could also consider using a static wallpaper instead of a live wallpaper.

You should also be aware that if you update the device to a later Android release, the load on the built-in Dynamic Memory will increase due to the addition of more features. As a result, the device may run slower after an update.

The Xperia[™] C5 Ultra Dual has 2 GB of RAM available to the Android OS and any installed applications. About 1.2 GB of the total RAM is in use during normal operation when the user starts using the device out of the box.

- 2. System Memory (also known as "System partition" or "/system") is used for the Android OS and for most applications that are pre-loaded from the factory. This type of memory is normally locked, and can only be changed through a firmware upgrade. There is usually some free space available in this section of memory. However, since it is locked, you cannot save apps, photos or any other content to this memory. System Memory is reserved for future firmware upgrades, which almost always need more memory than the original firmware. You cannot see or influence the use of this memory.
- **3. Internal Storage** is referred to as "working" memory. It can be compared to the C: drive on a PC or to the startup disk on a Mac.

This type of memory is used to store all application downloaded from the Google Play™ Store (and other sources) as well as their settings and data (such as emails, messages and calendar events, for example). All applications have an allocated area for application data. Memory dedicated to an application is inaccessible to other applications.

Some game applications also store content such as game music and game level information outside their own designated area. In most cases, an application can choose to save its data in a location of its own choosing (outside the protected application settings area). Generally, such content is not deleted when an application is uninstalled; it must be removed manually by connecting the device to a computer with a USB cable, or by using a file manager application.

Internal storage is also used for all added user content. For example, photos taken using the device's camera, media files downloaded from the Internet and file transfers are stored in this area. Typical user content includes:

- photos
- movies
- music
- Email attachments

Internal Storage will tend to fill up as a result of normal usage. Devices with a large initial Internal Storage can handle more applications and store more user content.

If the Internal Storage starts to get full, the device slows down, and in some cases it might no longer be possible to install more apps. You should always ensure that you have at least 100 MB of free Internal Storage. If not, you should consider removing some apps that you seldom use, or move content that you do not frequently access to external storage.

You can see approximately how much Internal Storage is free in **Settings** > **Storage**. You can also view more details about how much memory is used by applications under **Settings** > **Apps**. Depending on the particular variant of the device, the Xperia[™] C5 Ultra Dual has approximately 9.6 GB of Internal Storage available out of the box.

Please note that in Sony Mobile 2015 products, "Internal Storage" is now the combination of what was previously known as "Device Memory" or "Phone Memory" (for applications and their data – also previously known as "/data") and "Internal Storage" (for user's content – also previously known as "/sdcard"). The changes in Internal Storage were made so that memory usage could be more flexible and to allow encryption of user content.

Memory card slot

Some products include both a large internal memory and a built-in memory card reader. Android manages devices with a built-in memory card reader and internal memory differently from a device that includes only a built-in memory card reader.

Since most applications expect only a single location for storage, such applications will not generally allow you to SAVE anything to the memory card (i.e., they do not offer the option to choose a storage location). However, some applications (for instance, the Sony Mobile "Camera" application) may actually allow you to do so. Other applications, for example, backup applications such as the Sony Mobile "Memory" application, will by definition be configured to copy content from the Internal Storage to the external SD card.

On the other hand, when it comes to reading from an external SD Card, you will be able to access content (for example, videos, photos and music) on a memory card inserted in this slot without any special consideration since the Android system searches all available memory for content. Therefore, such products may be regarded as supporting a fourth type of memory, called "External Card" or "SD Card".

4. **SD Card** (known as "/sdcard1" from a programmer's point of view, or by other names in other Android products) is the name for the removable SD memory card in all 2015 Sony Mobile products. As described in the previous section, this External Card memory is generally more limited in that any application can read from it, but many applications cannot save to this card. Only a few applications, including backup applications and file manger applications, have the capability to save to this card.

Backing up data to different memory types

Generally, you should not save photos, videos and other personal content solely on the internal memory of a device. If something should happen with the hardware, or if the device is lost or stolen, the data stored on the device's internal memory is gone forever.

In a device where an SD card reader is the main memory, it is relatively easy to take the card out and copy all content to a PC or Mac, or to an entertainment device with a memory card slot. In a product featuring Internal Storage as the main memory, it is not possible to physically remove the memory. Instead, any critical or high-value content must either be copied to an external SD card by a special backup application, transferred to remote storage over a network (mobile or Wi-Fi), or to a computer via a USB cable.

To facilitate the transfer of data via a cable, the Xperia[™] C5 Ultra Dual supports Media Transfer Protocol (MTP), which makes it possible to easily transfer content back and forth between your device and a Windows® PC or an Apple[™] Mac® computer. This application is called Xperia[™] Companion and it can be downloaded from the Xperia[™] C5 Ultra Dual support page.

Note that you do not need to back up or make a copy of applications that you have downloaded from the Google Play™ Store. They can normally be downloaded again after you have set up your Google account to work in a new device (or in a device where the memory has been completely erased).

Note 1

Some Android devices, including Sony Mobile devices from 2012 and Sony Ericsson devices from 2011 and earlier, do not use a single "Internal Storage" for both applications (and their data) and user content. Instead, these devices use either an external SD card for user content, or a corresponding area of internal memory to reproduce the functionality of an SD card. In such devices, there is a fixed limit between the application area ("/data") and the user content area ("/sdcard"), with the result that user content can build up and reach this limit. When the user content reaches this limit, no additional data can be added using any application. For example, the camera application would no longer be able to capture additional photos even if a considerable amount of free space was available in the application area. This limit also applies to the application area. Downloading and installing new applications would not be possible even if there was enough free memory in the user content area.

Note 2:

Some devices with integrated storage have abandoned the distinction between the application area and the content area when it comes to a Factory Data Reset. As a result, there is no option in such devices to perform a Factory Data Reset and preserve content. In such devices, all content is completely deleted from the device when a reset is performed.

In contrast, Sony Mobile's memory integration solution makes it possible to preserve user content in this situation. Therefore, when performing a Factory Data Reset, the default action will still be to only remove applications and their data, and an option box must be checked if all content is to be removed as well (as might be desirable when selling the device second-hand).

Note 3:

For a developer, it is important to note that from a programming point of view the location names used to refer to the different memory areas described in Note 1 are still valid, i.e., the area used for applications ("/ data") is still present, as is the area used for content ("/sdcard").

In reality, "sdcard" is a "symbolic link" to "/data/media". However, from inside an Android application, "/ sdcard" can still be used. For example, you can use "sdcard/DCIM/100Android" to find all camera images. The continued use of "/sdcard" to access the content area ensures compatibility across different products and Android releases in this regard.
